# Strategy for Using Multi-GNSS Signals (1)

## L1 Frequency Signals (G1, E1, B1)

- ◆ Do acquisition and tracking as with the GPS L1CA
- ◆ Differences are ...
  - ◆ Chip rate and chip length
    - ▶ Difference is only replica code generation
  - ◆ Modulation type (E1:BOC)
    - ▶ We need to change a part of tracking method
  - ◆ Navigation Message
    - ▶ Read ICD and implement it!

Not so difficult except for decoding navigation message!

# Strategy for Using Multi-GNSS Signals (2)

## Other Frequency Signals (G2, E5ab, B2I, L5, LEX...)

- ◆ If L1 code is tracked, the Doppler and code phase computation is aided by L1 information
  - ◆  $Doppler2 = Freq2 / Freq1 * Doppler1$
  - ◆  $Cphase2 = Cphase1 + (DCB)$

Acquisition is not necessary

- ◆ No need to decode navigation data
  - ◆ But time information is useful
  - ◆ Additional information in another navigation message

Only tracking loop is needed to generate pseudorange and carrier phase
